Nốt

One positive note every day

Introduction

Tiny Wins (Nốt) is a mobile app for burned-out final-year students like Minh (22): every evening they drop one small win into a jar instead of staring at an unfinished to-do list. After a rough day, the jar hands back an old win to remember. Small bravery and movement challenges, a one-tap self-control log and a guided journal help them rebuild confidence, one note at a time. Success criterion: log a mood and one win in under 30 seconds.

Figma vs app

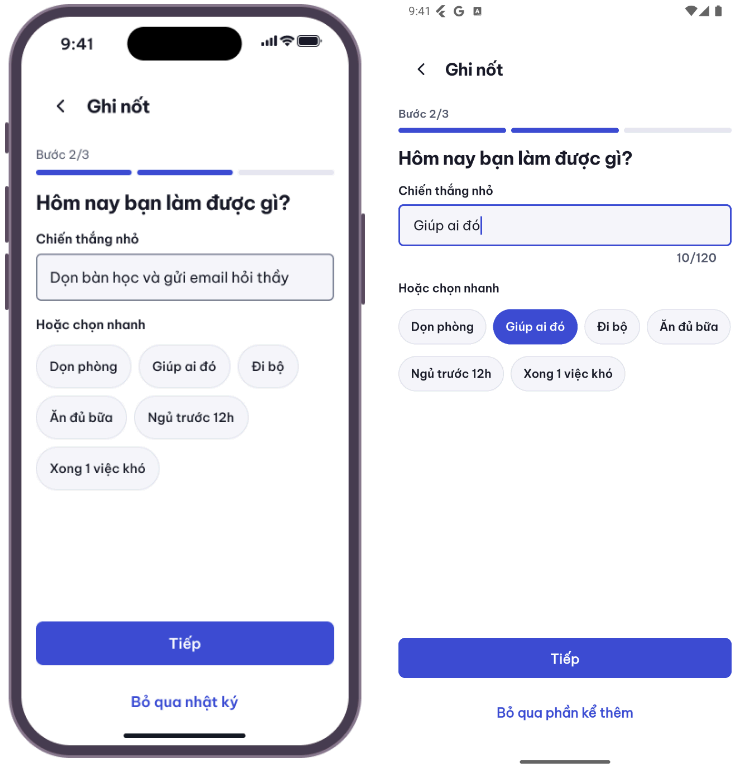

Today

Figma App

- Android status bar (D-04)
- New shortcut icons and captions (D-25)
- "Ghi nốt" asks win or journal first (D-29)

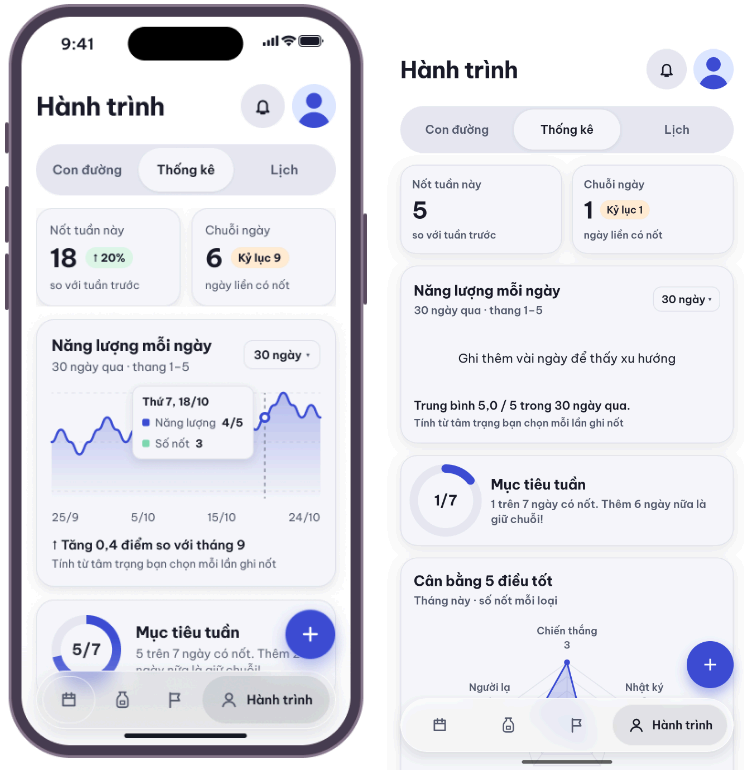

Write a note

Figma App

- "Bỏ qua nhật ký" is now "Bỏ qua phần kể thêm" (D-28)
- 0/120 counter under the field (D-02)
- AI free-tell is planned, not built

Stats

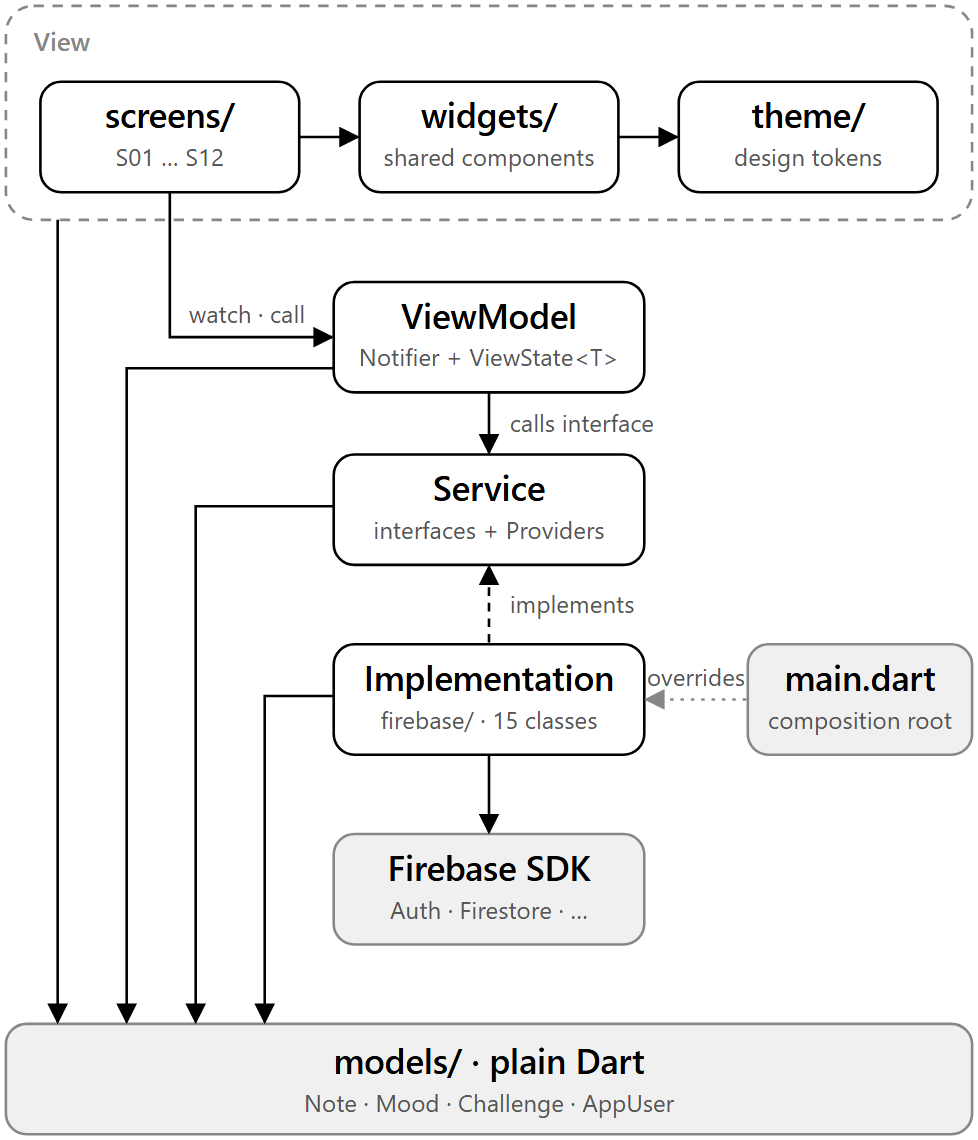

Figma App

- Compared with the previous 30 days (D-18)
- Chart scales to the card width (D-09)
- Weekly goal opens the weekly card (D-06)

Analytics

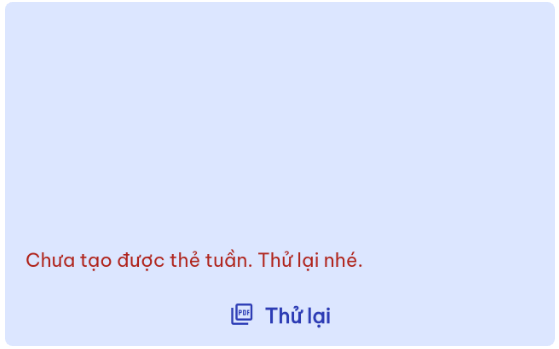

DebugView · top events of one run on the emulator

Eight custom events go through an `AnalyticsService` interface (Firebase in the app, a console logger on the Emulator). No titles, note text, emails or names are logged. The Firebase user ID is set after sign-in and cleared on sign-out.

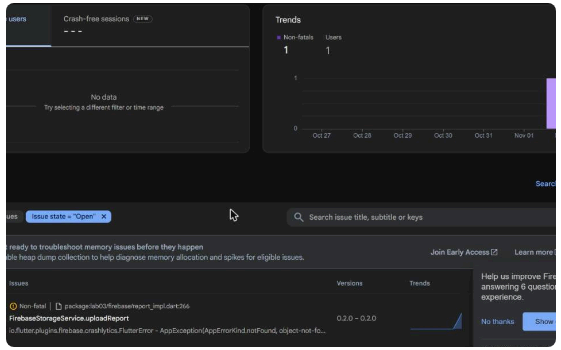

- **login / logout** · `method`
- **note_saved** · `mood, note_type, has_journal, duration_ms`. Tracks the 30-second goal: 7.7 s in this run.
- **note_viewed** · `note_type`
- **challenge_opened / challenge_completed** · `challenge_id, note_type`
- **self_control_logged** · `has_habit`
- **report_exported** · `format`. Fires after a successful upload, so it needs the Storage bucket.

Checked three ways: DebugView (left), `adb logcat` for all events except report_exported, and unit tests that assert the parameters.

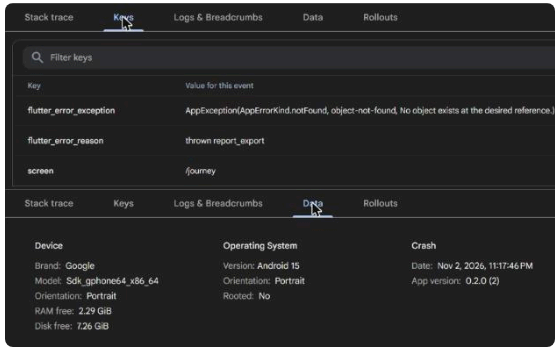

Crashlytics

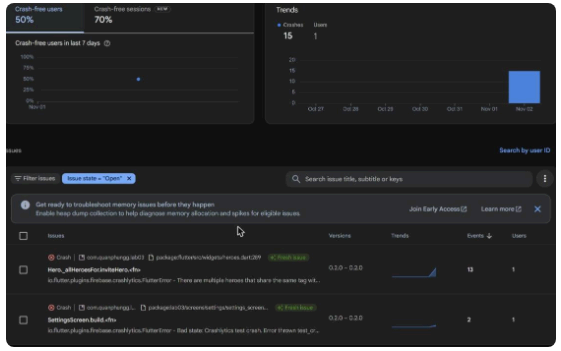

1 · User still sees a message

2 · Non-fatal in Console

3 · Key screen · user ID

4 · Test crash + a real Hero error

Crashlytics collects errors from real devices, so we see problems the Emulator never shows. Two kinds reach the dashboard:

- **Non-fatal**: the app caught the error and kept running. Exporting the weekly card fails because the Storage bucket is not provisioned; the user sees "Chưa tạo được thẻ tuần. Thử lại nhé." and the app records the error (1, 2).
- **Context on every report**: the Firebase user ID and a custom key `screen` (here `/journey`) show who hit it and where (3).
- **Crash**: a dev-only "Thử crash" button sends a test crash. The same dashboard also surfaced a real Hero error, caused by two add-note buttons sharing one tag. We fixed it with `heroTag: null` (4).

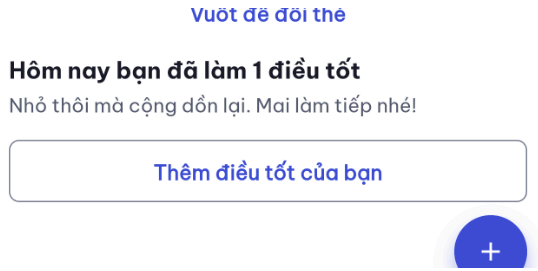

Remote Config

groups_enabled = true

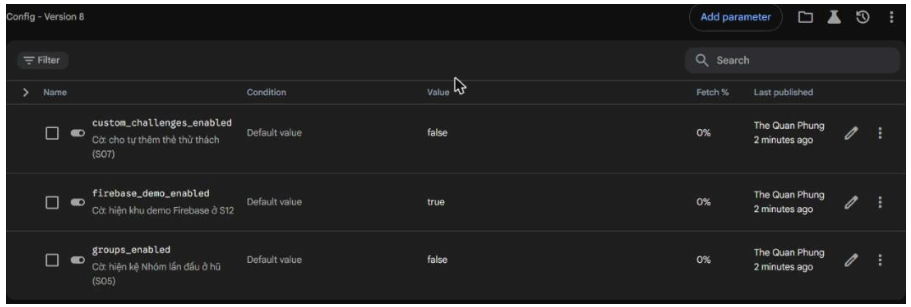

groups_enabled = false

custom_challenges_enabled = true

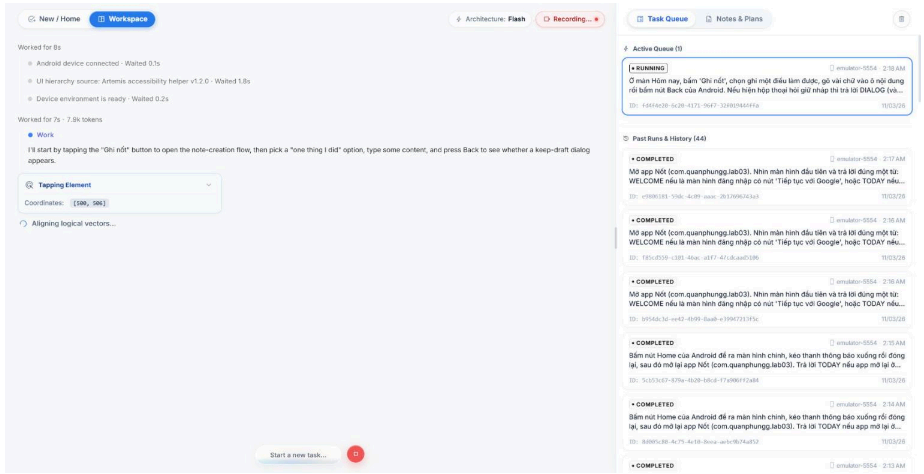

custom_challenges_enabled = false

Console · three feature flags

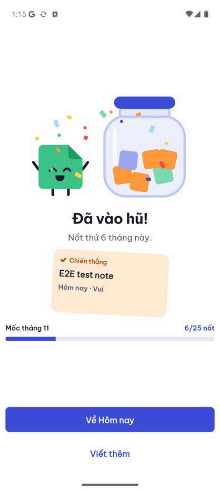

ARTEMIS E2E

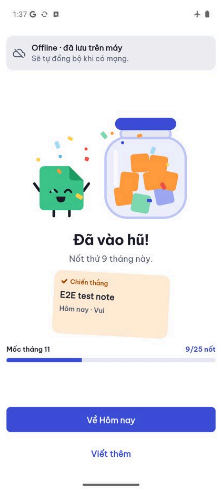

ARTEMIS Workspace · agent steps and run history (44 runs)

An AI agent (`deepseek-v4.1-flash` via OpenRouter) drives the app on the Android 15 emulator over ADB. Each case runs 3 times and asserts on the value the agent reports.

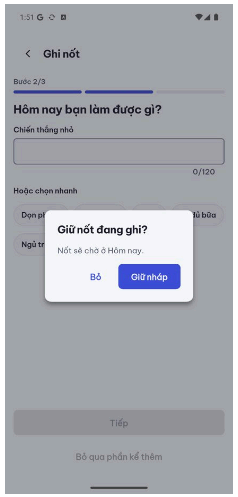

- **12 cases:** F1 save, empty, draft dialog, offline · F2 · F3 · tabs · flags · native Home and relaunch
- **35 of 36 runs pass.** T06 (offline) timed out once.
- First run was 31 of 36: two assertions in our tests were wrong (fixed, re-run 6 of 6).
- Not done yet: the 15 to 30 minute exploratory session.

AI code review

CodeRabbit reviewed every PR: 52 findings on #28, #29 and #38

Finding	Kind	Decision	Reason · commit
Restored session has no Analytics user ID	Correctness	Fixed	Router sets the ID on every auth change · 211a4d5
FCM inbox survives sign-out	Privacy · Major	Fixed	Sign-out clears the inbox · 736453a
Foreground notification has no route payload	Correctness	Fixed	Payload carries the route, tap opens it · 5e13651
No context.mounted check after await	Stability	Accepted	Settings can throw if the user leaves mid-call
Pass iOS settings to notifications init	Correctness · Major	Won't fix	The app ships on Android and web only
Add-card sheet can submit twice	Correctness	Rejected	canSubmit already reads _saving

51 of 52 right · 40 real bugs, 11 not worth it, 1 wrong · **3 fixed, one commit each** · full list in docs/code-review.md

Lessons learned

- **Test on the real project early.** The Emulator has no Analytics, Crashlytics, Remote Config or FCM, so Stage 5 only worked once we connected the real project.
- **Design documents can disagree.** Two Lab 2 documents set different title limits; we picked one and logged it (D-11).
- **Labels that users misread must change.** "Bỏ qua nhật ký" became "Bỏ qua phần kể thêm" (D-28).
- **An AI tester needs checking too.** The first ARTEMIS run failed 5 of 36; two causes were wrong assertions in our tests, not app bugs.
- **AI review only helps if someone reads it.** CodeRabbit was right on 51 of 52 findings, but we had fixed only 1 of 40 real bugs when we merged.
